(57) **ABSTRACT**

A telescopic light base couples decorative light fixtures to a flower pot or other similar container. The decorative light fixture may then be used to illuminate the contents of the pot. The telescopic light base has a ground-engaging pad upon which the pot rests. The weight of the pot then serves to anchor the telescopic light base in place. A telescopic pole support of variable length is coupled at a first end to the ground-engaging pad. At an end of the telescopic pole support distal to the ground-engaging pad, a pot upper rim retention arm is provided which operatively passes within the pot side-walls. Adjacent to the pot upper rim retention arm is a lamp-post connector. The telescopic pole support may be contracted to capture a pot between the ground-engaging pad and pot upper rim retention arm, and then later expanded and separated from the pot.
